### Proposition 13

To inscribe a circle in a given pentagon, which is equilateral and equiangular.

Let  $ABCDE$  be the given equilateral and equiangular pentagon. So it is required to inscribe a circle in pentagon  $ABCDE$ .

For let angles  $BCD$  and  $CDE$  have each been cut in half by each of the straight-lines  $CF$  and  $DF$  (respectively) [Prop. 1.9]. And from the point  $F$ , at which the straight-lines  $CF$  and  $DF$  meet one another, let the straight-lines  $FB$ ,  $FA$ , and  $FE$  have been joined. And since  $BC$  is equal to  $CD$ , and  $CF$  (is) common, the two (straight-lines)  $BC$ ,  $CF$  are equal to the two (straight-lines)  $DC$ ,  $CF$ . And angle  $BCF$  [is] equal to angle  $DCF$ . Thus, the base  $BF$  is equal to the base  $DF$ , and triangle  $BCF$  is equal to triangle  $DCF$ , and the remaining angles will be equal to the (corresponding) remaining angles which the equal sides subtend [Prop. 1.4]. Thus, angle  $CBF$  (is) equal to  $CDF$ . And since  $CDE$  is double  $CDF$ , and  $CDE$  (is) equal to  $ABC$ , and  $CDF$

to  $CBF$ ,  $CBA$  is thus also double  $CBF$ . Thus, angle  $ABF$  is equal to  $FBC$ . Thus, angle  $ABC$  has been cut in half by the straight-line  $BF$ . So, similarly, it can be shown that  $BAE$  and  $AED$  have been cut in half by the straight-lines  $FA$  and  $FE$ , respectively. So let  $FG$ ,  $FH$ ,  $FK$ ,  $FL$ , and  $FM$  have been drawn from point  $F$ , perpendicular to the straight-lines  $AB$ ,  $BC$ ,  $CD$ ,  $DE$ , and  $EA$  (respectively) [Prop. 1.12]. And since angle  $HCF$  is equal to  $KCF$ , and the right-angle  $FHC$  is also equal to the [right-angle]  $FKC$ ,  $FHC$  and  $FKC$  are two triangles having two angles equal to two angles, and one side equal to one side, (namely) their common (side)  $FC$ , subtending one of the equal angles. Thus, they will also have the remaining sides equal to the (corresponding) remaining sides [Prop. 1.26]. Thus, the perpendicular  $FH$  (is) equal to the perpendicular  $FK$ . So, similarly, it can be shown that  $FL$ ,  $FM$ , and  $FG$  are each equal to each of  $FH$  and  $FK$ . Thus, the five straight-lines  $FG$ ,  $FH$ ,  $FK$ ,  $FL$ , and  $FM$  are equal to one another. Thus, the circle drawn with center  $F$ , and radius one of  $G$ ,  $H$ ,  $K$ ,  $L$ , or  $M$ , will also go through the remaining points, and will touch the straight-lines  $AB$ ,  $BC$ ,  $CD$ ,  $DE$ , and  $EA$ , on account of the angles at points  $G$ ,  $H$ ,  $K$ ,  $L$ , and  $M$  being right-angles. For if it does not touch them, but cuts them, it follows that a (straight-line) drawn at right-angles to the diameter of the circle, from its extremity, falls inside the circle. The very thing was shown (to be) absurd [Prop. 3.16]. Thus, the circle drawn with center  $F$ , and radius one of  $G$ ,  $H$ ,  $K$ ,  $L$ , or  $M$ , does not cut the straight-lines  $AB$ ,  $BC$ ,  $CD$ ,  $DE$ , or  $EA$ . Thus, it will touch them. Let it have been drawn, like  $GHKLM$  (in

the figure).

Thus, a circle has been inscribed in the given pentagon which is equilateral and equiangular. (Which is) the very thing it was required to do.
