## Proposition 54

If an area is contained by a rational (straight-line) and a first binomial (straight-line) then the square-root of the area is the irrational (straight-line which is) called binomial.<sup>†</sup>

For let the area  $AC$  be contained by the rational (straight-line)  $AB$  and by the first binomial (straight-line)  $AD$ . I say that square-root of area  $AC$  is the irrational (straight-line which is) called binomial.

For since  $AD$  is a first binomial (straight-line), let it have been divided into its (component) terms at  $E$ , and let  $AE$  be the greater term. So, (it is) clear that  $AE$  and  $ED$  are rational (straight-lines which are) commensurable in square only, and that the square on  $AE$  is greater than (the square on)  $ED$  by the (square) on (some straight-line) commensurable (in length) with ( $AE$ ), and that  $AE$  is commensurable (in length) with the rational (straight-line)  $AB$  (first) laid out [Def. 10.5]. So, let  $ED$  have been cut in half at point  $F$ . And since the square on  $AE$  is greater than (the square on)  $ED$  by the (square) on (some straight-line) commensurable (in length) with ( $AE$ ), thus if a (rectangle) equal to the fourth part of the (square) on the lesser (term)—

that is to say, the (square) on  $EF$ —falling short by a square figure, is applied to the greater (term)  $AE$ , then it divides it into (terms which are) commensurable (in length) [Prop. 10.17]. Therefore, let the (rectangle contained) by  $AG$  and  $GE$ , equal to the (square) on  $EF$ , have been applied to  $AE$ .  $AG$  is thus commensurable in length with  $EG$ . And let  $GH$ ,  $EK$ , and  $FL$  have been drawn from (points)  $G$ ,  $E$ , and  $F$  (respectively), parallel to either of  $AB$  or  $CD$ . And let the square  $SN$ , equal to the parallelogram  $AH$ , have been constructed, and (the square)  $NQ$ , equal to (the parallelogram)  $GK$  [Prop. 2.14]. And let  $MN$  be laid down so as to be straight-on to  $NO$ .  $RN$  is thus also straight-on to  $NP$ . And let the parallelogram  $SQ$  have been completed.  $SQ$  is thus a square [Prop. 10.53 lem.]. And since the (rectangle contained) by  $AG$  and  $GE$  is equal to the (square) on  $EF$ , thus as  $AG$  is to  $EF$ , so  $FE$  (is) to  $EG$  [Prop. 6.17]. And thus as  $AH$  (is) to  $EL$ , (so)  $EL$  (is) to  $KG$  [Prop. 6.1]. Thus,  $EL$  is the mean proportional to  $AH$  and  $GK$ . But,  $AH$  is equal to  $SN$ , and  $GK$  (is) equal to  $NQ$ .  $EL$  is thus the mean proportional to  $SN$  and  $NQ$ . And  $MR$  is also the mean proportional to the same—(namely),  $SN$  and  $NQ$  [Prop. 10.53 lem.].  $EL$  is thus equal to  $MR$ . Hence, it is also equal to  $PO$  [Prop. 1.43]. And  $AH$  plus  $GK$  is equal to  $SN$  plus  $NQ$ . Thus, the whole of  $AC$  is equal to the whole of  $SQ$ —that is to say, to the square on  $MO$ . Thus,  $MO$  (is) the square-root of (area)  $AC$ . I say that  $MO$  is a binomial (straight-line).

For since  $AG$  is commensurable (in length) with  $GE$ ,

$AE$  is also commensurable (in length) with each of  $AG$  and  $GE$  [Prop. 10.15]. And  $AE$  was also assumed (to be) commensurable (in length) with  $AB$ . Thus,  $AG$  and  $GE$  are also commensurable (in length) with  $AB$  [Prop. 10.12]. And  $AB$  is rational.  $AG$  and  $GE$  are thus each also rational. Thus,  $AH$  and  $GK$  are each rational (areas), and  $AH$  is commensurable with  $GK$  [Prop. 10.19]. But,  $AH$  is equal to  $SN$ , and  $GK$  to  $NQ$ .  $SN$  and  $NQ$ —that is to say, the (squares) on  $MN$  and  $NO$  (respectively)—are thus also rational and commensurable. And since  $AE$  is incommensurable in length with  $ED$ , but  $AE$  is commensurable (in length) with  $AG$ , and  $DE$  (is) commensurable (in length) with  $EF$ ,  $AG$  (is) thus also incommensurable (in length) with  $EF$  [Prop. 10.13]. Hence,  $AH$  is also incommensurable with  $EL$  [Props. 6.1, 10.11]. But,  $AH$  is equal to  $SN$ , and  $EL$  to  $MR$ . Thus,  $SN$  is also incommensurable with  $MR$ . But, as  $SN$  (is) to  $MR$ , (so)  $PN$  (is) to  $NR$  [Prop. 6.1].  $PN$  is thus incommensurable (in length) with  $NR$  [Prop. 10.11]. And  $PN$  (is) equal to  $MN$ , and  $NR$  to  $NO$ . Thus,  $MN$  is incommensurable (in length) with  $NO$ . And the (square) on  $MN$  is commensurable with the (square) on  $NO$ , and each (is) rational.  $MN$  and  $NO$  are thus rational (straight-lines which are) commensurable in square only.

Thus,  $MO$  is (both) a binomial (straight-line) [Prop. 10.36], and the square-root of  $AC$ . (Which is) the very thing it was required to show.
