## Proposition 33

To find the least of those (numbers) having the same ratio as any given multitude of numbers.

Let  $A$ ,  $B$ , and  $C$  be any given multitude of numbers. So it is required to find the least of those (numbers) having the same ratio as  $A$ ,  $B$ , and  $C$ .

For  $A$ ,  $B$ , and  $C$  are either prime to one another, or not. In fact, if  $A$ ,  $B$ , and  $C$  are prime to one another then they are the least of those (numbers) having the same ratio as them [Prop. 7.22].

And if not, let the greatest common measure,  $D$ , of  $A$ ,  $B$ , and  $C$  have been taken [Prop. 7.3]. And as many times as  $D$  measures  $A$ ,  $B$ ,  $C$ , so many units let there be in  $E$ ,  $F$ ,  $G$ , respectively. And thus  $E$ ,  $F$ ,  $G$  measure  $A$ ,  $B$ ,  $C$ , respectively, according to the units in  $D$  [Prop. 7.15]. Thus,  $E$ ,  $F$ ,  $G$  measure  $A$ ,  $B$ ,  $C$  (respectively) an equal number of times. Thus,  $E$ ,  $F$ ,  $G$  are in the same ratio as  $A$ ,  $B$ ,  $C$  (respectively) [Def. 7.20]. So I say that (they are) also the least (of those numbers having the same ratio as  $A$ ,  $B$ ,  $C$ ). For if  $E$ ,  $F$ ,  $G$  are not the least of those (numbers) having the same ratio as  $A$ ,  $B$ ,  $C$  (respectively), then there will be [some] numbers less than  $E$ ,  $F$ ,  $G$  which are in the same ratio as

$A, B, C$  (respectively). Let them be  $H, K, L$ . Thus,  $H$  measures  $A$  the same number of times that  $K, L$  also measure  $B, C$ , respectively. And as many times as  $H$  measures  $A$ , so many units let there be in  $M$ . Thus,  $K, L$  measure  $B, C$ , respectively, according to the units in  $M$ . And since  $H$  measures  $A$  according to the units in  $M$ ,  $M$  thus also measures  $A$  according to the units in  $H$  [Prop. 7.15]. So, for the same (reasons),  $M$  also measures  $B, C$  according to the units in  $K, L$ , respectively. Thus,  $M$  measures  $A, B$ , and  $C$ . And since  $H$  measures  $A$  according to the units in  $M$ ,  $H$  has thus made  $A$  (by) multiplying  $M$ . So, for the same (reasons),  $E$  has also made  $A$  (by) multiplying  $D$ . Thus, the (number created) from (multiplying)  $E$  and  $D$  is equal to the (number created) from (multiplying)  $H$  and  $M$ . Thus, as  $E$  (is) to  $H$ , so  $M$  (is) to  $D$  [Prop. 7.19]. And  $E$  (is) greater than  $H$ . Thus,  $M$  (is) also greater than  $D$  [Prop. 5.13]. And ( $M$ ) measures  $A, B$ , and  $C$ . The very thing is impossible. For  $D$  was assumed (to be) the greatest common measure of  $A, B$ , and  $C$ . Thus, there cannot be any numbers less than  $E, F, G$  which are in the same ratio as  $A, B, C$  (respectively). Thus,  $E, F, G$  are the least of (those numbers) having the same ratio as  $A, B, C$  (respectively). (Which is) the very thing it was required to show.
