### Proposition 11

To find a third (straight-line) proportional to two given straight-lines.

Let  $BA$  and  $AC$  be the [two] given [straight-lines], and let them be laid down encompassing a random angle. So it is required to find a third (straight-line) proportional to  $BA$  and  $AC$ . For let ( $BA$  and  $AC$ ) have been produced to points  $D$  and  $E$  (respectively), and let  $BD$  be made equal to  $AC$  [Prop. 1.3]. And let  $BC$  have been joined. And let  $DE$  have been drawn through (point)  $D$  parallel to it [Prop. 1.31].

Therefore, since  $BC$  has been drawn parallel to one of the sides  $DE$  of triangle  $ADE$ , proportionally, as  $AB$  is to  $BD$ , so  $AC$  (is) to  $CE$  [Prop. 6.2]. And  $BD$  (is) equal to  $AC$ . Thus, as  $AB$  is to  $AC$ , so  $AC$  (is) to  $CE$ .

Thus, a third (straight-line),  $CE$ , has been found (which is) proportional to the two given straight-lines,  $AB$  and  $AC$ . (Which is) the very thing it was required to do.
