

## Book 6 Proposition 1

Triangles and parallelograms which are of the same height are to one another as their bases.

Let  $ABC$  and  $ACD$  be triangles, and  $EC$  and  $CF$  parallelograms, of the same height  $AC$ . I say that as base  $BC$  is to base  $CD$ , so triangle  $ABC$  (is) to triangle  $ACD$ , and parallelogram  $EC$  to parallelogram  $CF$ .

For let the (straight-line)  $BD$  have been produced in each direction to points  $H$  and  $L$ , and let [any number] (of straight-lines)  $BG$  and  $GH$  be made equal to base  $BC$ , and any number (of straight-lines)  $DK$  and  $KL$  equal to base  $CD$ . And let  $AG$ ,  $AH$ ,  $AK$ , and  $AL$  have been joined.

And since  $CB$ ,  $BG$ , and  $GH$  are equal to one another, triangles  $AHG$ ,  $AGB$ , and  $ABC$  are also equal to one another [Prop. 1.38]. Thus, as many times as base  $HC$  is (divisible by) base  $BC$ , so many times is triangle  $AHC$  also (divisible) by triangle  $ABC$ . So, for the same (reasons), as many times as base  $LC$  is (divisible) by base  $CD$ , so many times is triangle  $ALC$  also (divisible) by triangle  $ACD$ . And if base  $HC$  is equal to base

$CL$  then triangle  $AHC$  is also equal to triangle  $ACL$  [Prop. 1.38]. And if base  $HC$  exceeds base  $CL$  then triangle  $AHC$  also exceeds triangle  $ACL$ .<sup>‡</sup> And if ( $HC$  is) less (than  $CL$  then  $AHC$  is also) less (than  $ACL$ ). So, their being four magnitudes, two bases,  $BC$  and  $CD$ , and two triangles,  $ABC$  and  $ACD$ , equal multiples have been taken of base  $BC$  and triangle  $ABC$ —(namely), base  $HC$  and triangle  $AHC$ —and other random equal multiples of base  $CD$  and triangle  $ADC$ —(namely), base  $LC$  and triangle  $ALC$ . And it has been shown that if base  $HC$  exceeds base  $CL$  then triangle  $AHC$  also exceeds triangle  $ALC$ , and if ( $HC$  is) equal (to  $CL$  then  $AHC$  is also) equal (to  $ALC$ ), and if ( $HC$  is) less (than  $CL$  then  $AHC$  is also) less (than  $ALC$ ). Thus, as base  $BC$  is to base  $CD$ , so triangle  $ABC$  (is) to triangle  $ACD$  [Def. 5.5]. And since parallelogram  $EC$  is double triangle  $ABC$ , and parallelogram  $FC$  is double triangle  $ACD$  [Prop. 1.34], and parts have the same ratio as similar multiples [Prop. 5.15], thus as triangle  $ABC$  is to triangle  $ACD$ , so parallelogram  $EC$  (is) to parallelogram  $FC$ . In fact, since it was shown that as base  $BC$  (is) to  $CD$ , so triangle  $ABC$  (is) to triangle  $ACD$ , and as triangle  $ABC$  (is) to triangle  $ACD$ , so parallelogram  $EC$  (is) to parallelogram  $CF$ , thus, also, as base  $BC$  (is) to base  $CD$ , so parallelogram  $EC$  (is) to parallelogram  $FC$  [Prop. 5.11].

Thus, triangles and parallelograms which are of the same height are to one another as their bases. (Which is) the very thing it was required to show.
