## Proposition 87

To find a third apotome.

Let the rational (straight-line)  $A$  be laid down. And let the three numbers,  $E$ ,  $BC$ , and  $CD$ , not having to one another the ratio which (some) square number (has) to (some) square number, be laid down. And let  $CB$  have to  $BD$  the ratio which (some) square number (has) to (some) square number. And let it have been contrived that as  $E$  (is) to  $BC$ , so the square on  $A$  (is) to the square on  $FG$ , and as  $BC$  (is) to  $CD$ , so the square on  $FG$  (is) to the (square) on  $GH$  [Prop. 10.6 corr.]. Therefore, since as  $E$  is to  $BC$ , so the square on  $A$  (is) to the square on  $FG$ , the square on  $A$  is thus commensurable with the square on  $FG$  [Prop. 10.6]. And the square on  $A$  (is) rational. Thus, the (square) on  $FG$  (is) also rational. Thus,  $FG$  is a rational (straight-line). And since  $E$  does not have to  $BC$  the ratio which (some) square number (has) to (some) square number, the square on  $A$  thus does not have to the [square] on  $FG$  the ratio which (some) square number (has) to (some) square number either. Thus,  $A$  is incommensurable in length with  $FG$  [Prop. 10.9]. Again, since as  $BC$  is to  $CD$ , so the square on  $FG$  is to the (square) on  $GH$ , the square on  $FG$  is thus commensurable with the (square)

on  $GH$  [Prop. 10.6]. And the (square) on  $FG$  (is) rational. Thus, the (square) on  $GH$  (is) also rational. Thus,  $GH$  is a rational (straight-line). And since  $BC$  does not have to  $CD$  the ratio which (some) square number (has) to (some) square number, the (square) on  $FG$  thus does not have to the (square) on  $GH$  the ratio which (some) square number (has) to (some) square number either. Thus,  $FG$  is incommensurable in length with  $GH$  [Prop. 10.9]. And both are rational (straight-lines).  $FG$  and  $GH$  are thus rational (straight-lines which are) commensurable in square only. Thus,  $FH$  is an apotome [Prop. 10.73]. So, I say that (it is) also a third (apotome).

For since as  $E$  is to  $BC$ , so the square on  $A$  (is) to the (square) on  $FG$ , and as  $BC$  (is) to  $CD$ , so the (square) on  $FG$  (is) to the (square) on  $HG$ , thus, via equality, as  $E$  is to  $CD$ , so the (square) on  $A$  (is) to the (square) on  $HG$  [Prop. 5.22]. And  $E$  does not have to  $CD$  the ratio which (some) square number (has) to (some) square number. Thus, the (square) on  $A$  does not have to the (square) on  $GH$  the ratio which (some) square number (has) to (some) square number either.  $A$  (is) thus incommensurable in length with  $GH$  [Prop. 10.9]. Thus, neither of  $FG$  and  $GH$  is commensurable in length with the (previously) laid down rational (straight-line)  $A$ . Therefore, let the (square) on  $K$  be that (area) by which the (square) on  $FG$  is greater than the (square) on  $GH$  [Prop. 10.13 lem.]. Therefore, since as  $BC$  is to  $CD$ , so the (square) on  $FG$  (is) to the (square) on  $GH$ , thus, via conversion, as  $BC$  is to  $BD$ , so the square on  $FG$  (is) to

the square on  $K$  [Prop. 5.19 corr.]. And  $BC$  has to  $BD$  the ratio which (some) square number (has) to (some) square number. Thus, the (square) on  $FG$  also has to the (square) on  $K$  the ratio which (some) square number (has) to (some) square number.  $FG$  is thus commensurable in length with  $K$  [Prop. 10.9]. And the square on  $FG$  is (thus) greater than (the square on)  $GH$  by the (square) on (some straight-line) commensurable (in length) with ( $FG$ ). And neither of  $FG$  and  $GH$  is commensurable in length with the (previously) laid down rational (straight-line)  $A$ . Thus,  $FH$  is a third apotome [Def. 10.13].

Thus, the third apotome  $FH$  has been found. (Which is) very thing it was required to show.
