## Proposition 35

If there are two equal plane angles, and raised straight-lines are stood on the apexes of them, containing equal angles respectively with the original straight-lines (forming the angles), and random points are taken on the raised (straight-lines), and perpendiculars are drawn from them to the planes in which the original angles are, and straight-lines are joined from the points created in the planes to the (vertices of the) original angles, then they will enclose equal angles with the raised (straight-lines).

Let  $BAC$  and  $EDF$  be two equal rectilinear angles. And let the raised straight-lines  $AG$  and  $DM$  have been stood on points  $A$  and  $D$ , containing equal angles respectively with the original straight-lines. (That is)  $MDE$  (equal) to  $GAB$ , and  $MDF$  (to)  $GAC$ . And let the random points  $G$  and  $M$  have been taken on  $AG$  and  $DM$  (respectively). And let the  $GL$  and  $MN$  have been drawn from points  $G$  and  $M$  perpendicular to the planes through  $BAC$  and  $EDF$  (respectively). And let them have joined the planes at points  $L$  and  $N$  (respectively). And let  $LA$  and  $ND$  have been joined. I say that angle  $GAL$  is equal to angle  $MDN$ .

Let  $AH$  be made equal to  $DM$ . And let  $HK$  have been drawn through point  $H$  parallel to  $GL$ . And  $GL$  is perpendicular to the plane through  $BAC$ . Thus,  $HK$  is also perpendicular to the plane through  $BAC$  [Prop. 11.8]. And let  $KC$ ,  $NF$ ,  $KB$ , and  $NE$  have been drawn from points  $K$  and  $N$  perpendicular to the straight-lines  $AC$ ,  $DF$ ,  $AB$ , and  $DE$ . And let  $HC$ ,  $CB$ ,  $MF$ , and  $FE$  have been joined. Since the (square) on  $HA$  is equal to the (sum of the squares) on  $HK$  and  $KA$  [Prop. 1.47], and the (sum of the squares) on  $KC$  and  $CA$  is equal to the (square) on  $KA$  [Prop. 1.47], thus the (square) on  $HA$  is equal to the (sum of the squares) on  $HK$ ,  $KC$ , and  $CA$ . And the (square) on  $HC$  is equal to the (sum of the squares) on  $HK$  and  $KC$  [Prop. 1.47]. Thus, the (square) on  $HA$  is equal to the (sum of the squares) on  $HC$  and  $CA$ . Thus, angle  $HCA$  is a right-angle [Prop. 1.48]. So, for the same (reasons), angle  $DFM$  is also a right-angle. Thus, angle  $ACH$  is equal to (angle)  $DFM$ . And  $HAC$  is also equal to  $MDF$ . So,  $MDF$  and  $HAC$  are two triangles having two an-

gles equal to two angles, respectively, and one side equal to one side—(namely), that subtending one of the equal angles —(that is),  $HA$  (equal) to  $MD$ . Thus, they will also have the remaining sides equal to the remaining sides, respectively [Prop. 1.26]. Thus,  $AC$  is equal to  $DF$ . So, similarly, we can show that  $AB$  is also equal to  $DE$ . Therefore, since  $AC$  is equal to  $DF$ , and  $AB$  to  $DE$ , so the two (straight-lines)  $CA$  and  $AB$  are equal to the two (straight-lines)  $FD$  and  $DE$  (respectively). But, angle  $CAB$  is also equal to angle  $FDE$ . Thus, base  $BC$  is equal to base  $EF$ , and triangle  $(ACB)$  to triangle  $(DFE)$ , and the remaining angles to the remaining angles (respectively) [Prop. 1.4]. Thus, angle  $ACB$  (is) equal to  $DFE$ . And the right-angle  $ACK$  is also equal to the right-angle  $DFN$ . Thus, the remainder  $BCK$  is equal to the remainder  $EFN$ . So, for the same (reasons),  $CBK$  is also equal to  $FEN$ . So,  $BCK$  and  $EFN$  are two triangles having two angles equal to two angles, respectively, and one side equal to one side—(namely), that by the equal angles—(that is),  $BC$  (equal) to  $EF$ . Thus, they will also have the remaining sides equal to the remaining sides (respectively) [Prop. 1.26]. Thus,  $CK$  is equal to  $FN$ . And  $AC$  (is) also equal to  $DF$ . So, the two (straight-lines)  $AC$  and  $CK$  are equal to the two (straight-lines)  $DF$  and  $FN$  (respectively). And they enclose right-angles. Thus, base  $AK$  is equal to base  $DN$  [Prop. 1.4]. And since  $AH$  is equal to  $DM$ , the (square) on  $AH$  is also equal to the (square) on  $DM$ . But, the (sum of the squares) on  $AK$  and  $KH$  is equal to the (square) on  $AH$ . For angle  $AKH$  (is) a right-angle

[Prop. 1.47]. And the (sum of the squares) on  $DN$  and  $NM$  (is) equal to the square on  $DM$ . For angle  $DNM$  (is) a right-angle [Prop. 1.47]. Thus, the (sum of the squares) on  $AK$  and  $KH$  is equal to the (sum of the squares) on  $DN$  and  $NM$ , of which the (square) on  $AK$  is equal to the (square) on  $DN$ . Thus, the remaining (square) on  $KH$  is equal to the (square) on  $NM$ . Thus,  $HK$  (is) equal to  $MN$ . And since the two (straight-lines)  $HA$  and  $AK$  are equal to the two (straight-lines)  $MD$  and  $DN$ , respectively, and base  $HK$  was shown (to be) equal to base  $MN$ , angle  $HAK$  is thus equal to angle  $MDN$  [Prop. 1.8].

Thus, if there are two equal plane angles, and so on of the proposition. [(Which is) the very thing it was required to show].

## Corollary

So, it is clear, from this, that if there are two equal plane angles, and equal raised straight-lines are stood on them (at their apexes), containing equal angles respectively with the original straight-lines (forming the angles), then the perpendiculars drawn from (the raised ends of) them to the planes in which the original angles lie are equal to one another. (Which is) the very thing it was required to show.
