

Book 2

Proposition 11

To cut a given straight-line such that the rectangle contained by the whole (straight-line), and one of the pieces (of the straight-line), is equal to the square on the remaining piece.

Let AB be the given straight-line. So it is required to cut AB such that the rectangle contained by the whole (straight-line), and one of the pieces (of the straight-line), is equal to the square on the remaining piece.

For let the square $ABDC$ have been described on AB [Prop. 1.46], and let AC have been cut in half at point E [Prop. 1.10], and let BE have been joined. And let CA have been drawn through to (point) F , and let EF be made equal to BE [Prop. 1.3]. And let the square FH have been described on AF [Prop. 1.46], and let GH have been drawn through to (point) K . I say that AB has been cut at H such as to make the rectangle

contained by AB and BH equal to the square on AH .

For since the straight-line AC has been cut in half at E , and FA has been added to it, the rectangle contained by CF and FA , plus the square on AE , is thus equal to the square on EF [Prop. 2.6]. And EF (is) equal to EB . Thus, the (rectangle contained) by CF and FA , plus the (square) on AE , is equal to the (square) on EB . But, the (sum of the squares) on BA and AE is equal to the (square) on EB . For the angle at A (is) a right-angle [Prop. 1.47]. Thus, the (rectangle contained) by CF and FA , plus the (square) on AE , is equal to the (sum of the squares) on BA and AE . Let the square on AE have been subtracted from both. Thus, the remaining rectangle contained by CF and FA is equal to the square on AB . And FK is the (rectangle contained) by CF and FA . For AF (is) equal to FG . And AD (is) the (square) on AB . Thus, the (rectangle) FK is equal to the (square) AD . Let (rectangle) AK have been subtracted from both. Thus, the remaining (square) FH is equal to the (rectangle) HD . And HD is the (rectangle contained) by AB and BH . For AB (is) equal to BD . And FH (is) the (square) on AH . Thus, the rectangle contained by AB and BH is equal to the square on HA .

Thus, the given straight-line AB has been cut at (point) H such as to make the rectangle contained by AB and BH equal to the square on HA . (Which is) the very thing it was required to do.
