

## Book 3

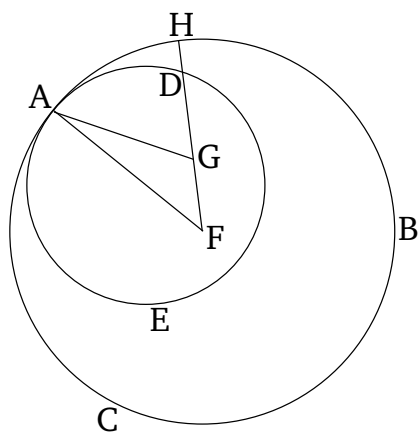

### Proposition 11

If two circles touch one another internally, and their centers are found, then the straight-line joining their centers, being produced, will fall upon the point of union of the circles.

For let two circles,  $ABC$  and  $ADE$ , touch one another internally at point  $A$ , and let the center  $F$  of circle  $ABC$  have been found [Prop. 3.1], and (the center)  $G$  of (circle)  $ADE$  [Prop. 3.1]. I say that the straight-line joining  $G$  to  $F$ , being produced, will fall on  $A$ .

For (if) not then, if possible, let it fall like  $FGH$  (in the figure), and let  $AF$  and  $AG$  have been joined.

Therefore, since  $AG$  and  $GF$  is greater than  $FA$ , that is to say  $FH$  [Prop. 1.20], let  $FG$  have been taken from both. Thus, the remainder  $AG$  is greater than the remainder  $GH$ . And  $AG$  (is) equal to  $GD$ . Thus,  $GD$  is also greater than  $GH$ , the lesser than the greater. The very thing is impossible. Thus, the straight-line joining  $F$  to  $G$  will not fall outside (one circle but inside the other). Thus, it will fall upon the point of union (of the circles) at point  $A$ .

Thus, if two circles touch one another internally, [and their centers are found], then the straight-line joining their centers, [being produced], will fall upon the point of union of the circles. (Which is) the very thing it was required to show.
