## Proposition 42

A binomial (straight-line) can be divided into its (component) terms at one point only.<sup>†</sup>

Let  $AB$  be a binomial (straight-line) which has been divided into its (component) terms at  $C$ .  $AC$  and  $CB$  are thus rational (straight-lines which are) commensurable in square only [Prop. 10.36]. I say that  $AB$  cannot be divided at another point into two rational (straight-lines which are) commensurable in square only.

For, if possible, let it also have been divided at  $D$ , such that  $AD$  and  $DB$  are also rational (straight-lines which are) commensurable in square only. So, (it is) clear that  $AC$  is not the same as  $DB$ . For, if possible, let it be (the same). So,  $AD$  will also be the same as  $CB$ . And as  $AC$  will be to  $CB$ , so  $BD$  (will be) to  $DA$ . And  $AB$  will (thus) also be divided at  $D$  in the same (manner) as the division at  $C$ . The very opposite was assumed. Thus,  $AC$  is not the same as  $DB$ . So, on account of this, points  $C$  and  $D$  are not equally far from the point of bisection. Thus, by whatever (amount the sum of) the (squares) on  $AC$  and  $CB$  differs from (the sum of) the (squares) on  $AD$  and  $DB$ , twice the (rectangle contained) by  $AD$  and  $DB$  also differs from twice the (rectangle contained) by  $AC$  and  $CB$  by this (same amount)—on account of both (the sum of) the (squares) on  $AC$  and  $CB$ , plus twice the (rectangle contained) by  $AC$  and  $CB$ , and (the sum of) the (squares) on  $AD$  and  $DB$ , plus twice the

(rectangle contained) by  $AD$  and  $DB$ , being equal to the (square) on  $AB$  [Prop. 2.4]. But, (the sum of) the (squares) on  $AC$  and  $CB$  differs from (the sum of) the (squares) on  $AD$  and  $DB$  by a rational (area). For (they are) both rational (areas). Thus, twice the (rectangle contained) by  $AD$  and  $DB$  also differs from twice the (rectangle contained) by  $AC$  and  $CB$  by a rational (area, despite both) being medial (areas) [Prop. 10.21]. The very thing is absurd. For a medial (area) cannot exceed a medial (area) by a rational (area) [Prop. 10.26].

Thus, a binomial (straight-line) cannot be divided (into its component terms) at different points. Thus, (it can be so divided) at one point only. (Which is) the very thing it was required to show.
